The step of retrieving a further content item may comprise retrieving a part of a master copy of the content item, the part not being present in the content item. Sometimes, the beginning or ending of a television "TV" program, e.g. credits of a movie, may be missing. There may also be an interfered part due to a bad signal. This may not be a problem for temporarily stored content, but is not desirable in permanently stored content. The missing or interfered parts may be retrieved to make the content item of the same quality as the master copy. Furthermore, the master copy may comprise multiple layers of data, in which the combination of all of the multiple layers represents a highest quality. If not all of the multiple layers are present in the content item, a missing layer may be retrieved to make the content item of the same quality as the master copy.

Please replace the paragraph beginning on page 3, line 26 with the following new paragraph:

In Fig.1, the method of storing content on a removable medium comprises a step 1 providing a user interface for selecting a content item stored on a storage means. The storage means may be, for example, a hard disk or a DVD-writer containing a DVD+RW. A user may, for example, be able to select the content item based on its title, on an index number, or on a date and/or time of recording. The method also comprises a step 3 of retrieving a further content item related to the content item from a system on a network using an identification of the content item. The user may be able to determine which of multiple further content items is retrieved, for example, in a further step of the method or during configuration of the method. The network may be, for example, the Internet and the system may be, for instance, an Hyper Text Transfer Protocol "HTTP" server. The identification may be, for example, a title, a fingerprint of the content item, an identifier embedded in the content item, or an identifier embedded in an electronic program guide
